

Exercise #6 Reflections

Understanding the problem

This project was fairly simple to understand since it was just building off of the previous skillbuilder I had done. I had found the math portion confusing so I ended up actually calculating it on my own just to lay it out before I put it in my code.

Planning the solution

So I completed my IPO chart first just to lay out what order the calculations had to occur in.

Implementation

I attempted the entire code all at once since it isn't very long, and due to the fact that I had previously done most of the calculations in my skill builder. Since I had tested my original digit code I knew that the setup worked and outputted the needed information and so I added on from there using the same structures.

Overcoming challenges

The hardest part was learning how to set up the scanner and structure before I even started the main coding process. I used websites such as w3schools and class demos to learn what needed to be included and why.

Learning

Definitely just everything I learned about the structure of Java coding and certain functions and signs will benefit me later now that I am learning the basics for all code.
