

Understanding the problem

This project was fairly simple, it was similar to the hurricane skillbuilder I had done in reference to the ranges. And the math portion was simple, easy, and straight to the point.

Planning the solution

Ensuring I understood the problem and being able to identify the input and outputs of the entire application made the writing of the program significantly easier. The IPO chart helped to lay this out.

Implementation

I entered the information I knew had to be inputted and outputted first, but I followed the order of the question so it was written pretty much from start to finish.

Overcoming challenges

None of this exercise was necessarily challenging but I definitely had to be aware of my ranges and ensure that I was not missing any values. Also just making sure that my code was readable and clean.
