

Understanding the problem

This project was fairly simple, and easy to understand. I just dove right into it.

Planning the solution

Just created the IPO chart but since there were only two possible outputs it was easy. At first I had planned to use an else-if statement since I knew that I would have to run the input value through multiple checks.

Implementation

I attempted the entire code at once since it was short and sweet, checking that each line ended up outputting my wanted statement depending on the input.

Overcoming challenges

I had started to write this with an else-if statement but then realized that my code would end up really messy since there were over 10 different defective values that the inputted value would have to go through. So I asked the teacher and he explained how to use a switch statement which cleans up the code when you have so many steps. There was definitely some trial and error when trying to figure out exactly how to switch statements worked.

Learning

Learning how to use the switch statement was very beneficial and will certainly help in the future when I am faced with similar tasks.
