

Exercise #5 Reflection

Understanding the problem

I had to do some research about double amounts because up to this point I had only been working with integers, but after I learned how to set it up it was smooth sailing. It followed similar patterns as my digits program in reference to the math portion.

Planning the solution

I started with my IPO chart and I mapped out the calculations necessary.

Implementation

I attempted to write the entire solution all at once. Due to every calculation being based off the one previously written I figured it would be easier and beneficial to attempt them in an orderly way that I could track the calculations throughout, avoiding any errors mathematically. However, once I had finished the code I decided I wanted to add a verification step that would ensure no matter what the user entered they would be told their change or that an error was present. I did have to use many websites to assist me while trying to figure out the 'while loop' structure in java.

Overcoming challenges

Adding the loop was definitely the most challenging part for myself, but just because we haven't actually covered it in class so I was just basing it off my own findings. However, I am glad that I decided to add that next feature because I enjoyed challenging myself to do things on my own before the lessons covered them.

Learning

I think this was a good assignment to practice checking my code throughout the entire program. It was good practice to establish good habits to avoid future unnecessary errors or miscalculations.
