

Error Log Entry - DigitsSum, Ch5 Ex6

What error message did you encounter (if any)?

- "Syntax error, insert ";" to complete LocalVariableDeclarationStatement"
- "Scanner cannot be resolved to a type"

What unexpected behaviour did your program exhibit?

- The program displayed syntax errors instead of output.
- My program wouldn't run due to an "unresolved compilation problem."
- My program wouldn't add the digits inputted by the user and was spitting out the wrong number.

What caused the issue? (ex, syntax error, logic error, incorrect function usage, etc)

- Syntax error (missing ";")
- Compilation error (forgot to import scanner)
- Logic error (forgot the addition assignment operator)

Include a screenshot of specific lines of code.

```
Scanner scanner = new Scanner(System.in);
```

```
int number
```

```
package Mastery;
```

```
public class DigitsSum {  
    public static void main(String[] args) {
```

```
Scanner scanner = new Scanner(System.in);
```

```
int number;
```

```
29      //variable to keep track of the sum of digits
30      int sum = 0;
31
32      //loop runs while the number is greater than 0
33      while (number > 0) { //check if there are still digits remaining
34          sum = number % 10; //get the last digit and add it to sum
35          number = number / 10; //remove the last digit from the number
36      }
37      //display the final result
38      System.out.println("The sum of the digits is: " + sum);
--
```

Console X

<terminated> DigitsSum [Java Application] C:\Program Files\Eclipse\plugins\org.eclipse.justj.openjdk.hotspot

Enter a non-negative integer: 55

The sum of the digits is: 5

How did you fix the issue?

- Added missing semicolons
- Imported Scanner before the class
- In line 34 I added the addition assignment operator (+=) where I had originally put just an assignment operator (=)

Provide the corrected code or solution using a screenshot.

```
Scanner scanner = new Scanner(System.in);
//variable to store the number entered by the user
int number;
```

```
package Mastery; //defines the package

import java.util.Scanner;

public class DigitsSum { //defines the class names DigitSum
    public static void main(String[] args) { //main method

        //create a scanner object to read input
        Scanner scanner = new Scanner(System.in);
        //variable to store the number entered by the user
        int number;
```

```
30         int sum = 0;
31
32         //loop runs while the number is greater than 0
33         while (number > 0) { //check if number is greater than 0
34             sum += number % 10; //get the last digit
35             number = number / 10; //remove the last digit
36         }
37         //display the final result
38         System.out.println("The sum of the digits is: " + sum);
39     }
40 }
```

Console X

```
<terminated> DigitsSum [Java Application] C:\Program Files\Java\jdk-9.0.4\bin\java.exe
Enter a non-negative integer: 55
The sum of the digits is: 10
```
