

ERROR LOG - EvensAndOdds

What error message did you encounter (if any)?

- The method `newRandom()` is undefined for the type `EvensAndOdds`
- The operator `+` is undefined for the argument type(s) `String`

What unexpected behaviour did your program exhibit?

- Presented an error message
- Wouldn't run the code due to a "unresolved compilation problem"
- My code was only outputting one odd value, and there were not 25 random values every time.

What caused the issue (syntax, logic, incorrect function usage)

- Logic errors
- Syntax error

Include a screenshot of specific lines of code.

```
public static void main(String[] args)
{
    Random random = newRandom();
```

```
System.out.println("Odd:  ");
System.out.println(+ oddNumbers);
System.out.println("Even:  " + evenNumbers);
```

```
    else {
        oddNumbers += number + " ";
    }
}
```

How did you fix the issue?

- Had to add a space between *new* and *Random*
- Remove the `+` operator in front of `oddNumbers`
- I had accidentally put `+=` instead of `+` which ended up replacing my previous odd value everytime a new one was generated, instead of adding it to the list it was adding the numbers, this was also why I was only getting one odd number every time.

Provide the corrected code or solution using a screenshot.

```
public static void main(String[] args)
{
    Random random = new Random();
```

```
System.out.println("Odd:  " );  
System.out.println(oddNumbers);
```

```
    else {  
        oddNumbers += number + " ";  
    }  
}
```
